                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monoclonal antibody; Mab; macaque; heavy chain; primate; antigen; CD80; CD86; inhibitor; immunosuppressant; treatment; autoimmune disease, IL-2; CP81/B cell interaction; tumour; inflammation; imaging agent; vaccine; immunogen; anti-idiotype reagent; interleukin-2; IgG; immunoglobulin G;
                                                                                                                            2 Polypeptides (AAW01817 and AAW01818) respectively comprise primatised forms of the light and heavy chains of cynomologus monkey anti-human B7.1 antigen monoclonal antibody 7010. Cloned 7010 light and heavy variable genes (see also AAT62509 and AAT62510) are inserted into variable genes (see also AAT62509 and AAT62510) are inserted into variable genes (see also AAT62509 and AAT62510) are inserted into variable years of pref. NEOSLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PGRGLEWIGHIYGNGATTNYNPSLKSRVIISKDISKNOFFLNLNSVIDADIAVYCARGP

This sequence represents a primatized form of the antibody 7C10 heavy chain from macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new manoclonal antibodies (MAD's) that bind selectively to BT.1 (CD80) or to BT.2 (CD86) antipons and inhibits binding of these antiqens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoinmune disease, specifically confidentiate thrombocytopaenia purpura, systemic lupus erythematosus, type of dispethic thrombocytopaenia purpura, systemic lupus erythematosus, type inflammatory bowel disease, allergy and multiple sciencisis, aplastic anaemia, const diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small modecule immunosuppressants. Blocking B7/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and this immunosuppression, i.e. it inhibits contingen specific immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EPVTVSWNSGALTSGVHTFPAVLQSSGLYSLSSVVTVPSSSLGTQTYICNVNHKPSNTKV 240

Searched: 127863 seqs, 47026705 residues
Total number of hits satisfying chosen parameters: 127863

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000 Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_41:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 613898
GENERAL INFORMATION:
FATEL OF INVENTION: MONKEY MONOCLONAL ANTIBODIES SPECIFIC
TITLE OF INVENTION: TO HUMAN B7.1 AND/OR B7.2 PRIMATIZED FORMS THEREOF,
TITLE OF INVENTION: PHARMACBUTIAL COMPOSITIONS CONTAINING, AND USE THEREOF AS
TITLE OF INVENTION: IMMUNOSUPPRESANTS'
NUMBER OF SECURACES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS
                                                    ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence encodes a primatized form of the antibody 7B6 light chain macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple solerosis, graft vs. host disease, B cell lymphoma, infections (including by human immune to be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions production of interleukin.2 (IL-2), T cell proliferation and multiple responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopenia purpura, systemic lupus, erythematosus, type 1 diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 Polypeptides (AAW01819 and AAW01820) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 786. Cloned 786 light and heavy variable genes (see also AAT62811 and AAT13847) are inserted into an expression vector (pref. NBOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibodies have also been produced (see also AAW01817-19 and AAW01821-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

This sequence represents a primatized form of the antibody 7B6 light chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigons and inhibits binding of these antigons to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving really earli interactions, particularly autoimmune disease, specifically idopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppression, i.e. it inhibits antigen-specific immunosuppression, and interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         YQQKPGQPPALLIYKVSNRDSGVPDRFSGSGAGTDFTLKISAVBAEDVGVYFCGQGTRTP 120

                                                                                                                                                                                                                                                                                                                                                                                This sequence encodes a primatized form of the antibody 7B6 heavy chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antipens and inhibits binding of these antiqens to CD28. Such MAD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumnours. Optionally the MAD as the conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppression, and antigen-specific immunosuppression and antigen-specific immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
